Growing Instructions

How to Grow Aquatic Plants from Seed

For better germination rate, aquatic plant seeds should to be germinated in normal environment before transplanting them into an aquarium.

Step 1: Aquatic Plant seeds are as tiny as dust particles, please be careful in handling the seeds.

Step 2: Take a tray or normal garden pot with holes at the bottom. You can use any kind of container by punching holes to it.

Step 3: Fill the tray/pot with potting media, for this you can use normal garden soil or cocopeat if available.

Step 4: Now, place a plate or saucer filled with water below the tray/pot, so that the potting media always stays wet. Please remember that soil/cocopeat should always be wet (damp).

Step 5: Finally, SURFACE SOW the seeds i.e., sow the seeds just above the potting media, do not cover the seeds. If the seeds are too large slightly cover them.

Step 6: When the plants were about 2 - 3 inches transplant them into your aquarium. Make sure that fishes in your aquarium are fed well before transplanting the plants.

Step 7: Care for your aquatic plants. Provide plants with adequate light and do not over crowd the aquarium with fishes.
