## How to Grow Plants from Seed

**Step 1:** Choose any fertile and well-drained soil. You can use an organic fertilizer like vermi-compost mixed with your soil in 50:50 ratio for better nutrition to your plants.

**Step 2:** Rather than sowing the seeds directly we recommend to sow them indoors in small containers first and then transplant them later outdoors. For better germination rate use cocopeat in this process.

**Step 3:** After sowing the seeds sprinkle or spray water on the soil. Make sure that the soil is always moist. Soil should never be dried/water logged. Use clean and chemical free water.

**Step 4:** Please be patient until germination, some seeds take really long time to germinate. Please refer to seeds label for germination time. After they have sprouted move them to natural light from indoors.

**Step 5:** Let the saplings grow for about 2-3 inches in the same containers. When it's time, transplant them onto ground or pots based on your space availability. Make sure that soil attached to roots is intact.

**Step 6:** Water your plants regularly. Keep adding organic manure at regular intervals. If you see any pests on your plants use an organic pesticide. Happy Gardening!!
